

Project Overview

Overview:

ResolveHub is an IT Help Desk and Ticketing Management System designed to help organizations manage internal technical support requests in a structured and efficient way.

Instead of employees reporting problems manually through calls, messages, or emails, ResolveHub allows them to create support tickets, track their progress, communicate with IT agents, and receive updates until the issue is resolved.

The system helps the IT teams organize requests, assign tickets to agents, prioritize urgent problems, monitor tickets status, and keep a clear history of actions taken on each ticket.

Project Scope:

The scope of ResolveHub includes the design and development of a web-based ticketing system that supports three main types of users:

1. Employees
2. IT Agents
3. Admins

Employees can create and track tickets. IT agents can manage assigned tickets and respond to issues. Admins can manage users, categories, ticket assignments, and system reports.

The system focuses on improving support organization, reducing response delays, and making ticket handling more transparent.

System Objectives:

The main objectives of ResolveHub are:

- Allow employees to submit IT support tickets easily.
- Categorize tickets based on issue type such as hardware, software, network, account access, or security.
- Allow admins to assign tickets to IT agents.
- Allow agents to update ticket status and respond to users.
- Track the full history of each ticket.
- Improve communication between employees and the IT support team.
- Provide dashboards and reports for monitoring support performance.
- Organize all support requests in one centralized system.

System Users and Roles:

1. **Employee:** The employee is the main user who reports technical issues to the IT department through ResolveHub. Employees can create support tickets, track their progress, receive updates, and communicate with the assigned IT Support Agent through ticket comments. When an agent marks a ticket as resolved, the employee can review the solution and either confirm that the issue is fixed by closing the ticket or reply that the issue still needs support.

The employee can:

- Login to the system.
- Create a new support ticket.
- Select ticket category and priority.

- Add a description of the issue.
- Upload attachments if needed.
- View submitted tickets.
- Track ticket status.
- Add comments or replies to tickets.
- Close a ticket after the issue is resolved.

2. **IT Support Agent:** The IT Support Agent is responsible for handling technical support tickets after they are assigned. This role focuses on investigating employee issues, communicating with the employees through ticket comments, updating ticket progress, and providing solutions until the issue is resolved.

IT Support Agents do not manage the whole system like admins, but they manage the tickets assigned to them and make sure each issue is handled professionally and efficiently.

IT Support Agent Responsibilities:

The IT support can:

- View tickets assigned to them.
- Open ticket details and review the employee's problem description.
- Check ticket category, priority, status, and attachments.
- Communicate with the employee through the ticket comment system.
- Add internal notes for technical follow-up.
- Change the ticket status from Assigned to In Progress, Pending, or Resolved.
- Request more information from the employee when needed.
- Escalate or request reassignment if the issue requires another specialist.
- Provide a final solution or troubleshooting steps.
- Track ticket history and previous updates.

3. **Admin:** The Admin has full control over the system. This role is responsible for managing users, roles, categories, ticket assignments, reports, and system

settings.

Admin responsibilities:

- Access the full system dashboard.
- View all tickets in the system.
- Create, update, and delete the user accounts.
- Assign roles to users.
- Manage employees, IT agents, and managers.
- Create, update, and delete ticket categories.
- Assign tickets to IT support agents.
- Reassign tickets when needed.
- Monitor ticket status and progress.
- View reports and analytics.
- View agent workload and performance.
- Manage system settings.
- View activity logs and audit history.
- Generate reports for management.

4. **Manager:** The manager role is used for monitoring and reporting. Managers do not handle ticket directly like agents, but they can review support performance and follow up on tickets related to their team.

Manager Permissions:

- Login to the system.
- View tickets submitted by the employees in their team or department.
- Monitor ticket status and progress.
- View reports and dashboard statistics.
- Track unresolved or delayed tickets.
- View ticket categories and priority distribution.

- Review employee support activity.
- Export reports if allowed by the admin.
